

Features

- 200-pin, unbuffered small outline, dual in-line memory module (SODIMM)
- JEDEC standard 1.8V ± 0.1V power supply
- VDDQ=1.8V ± 0.1V
- Fast data transfer rate: PC2-4200, PC2-5300, or PC2-6400
- Programmable CAS Latency(CL): 4, 5, 6
- Programmable Additive Latency(AL): 0, 1, 2, 3, 4 and 5
- Write Latency(WL) = Read Latency (RL)-1
- Programmable burst lengths: 4 or 8
- Differential data strobe (DQS, DQS#)
(Single ended data strobe option)
- On-die termination (ODT)
- Adjustable data-output drive strength
- 64ms, 8192-cycle refresh
- Serial Presence Detect (SPD) with EEPROM

Description

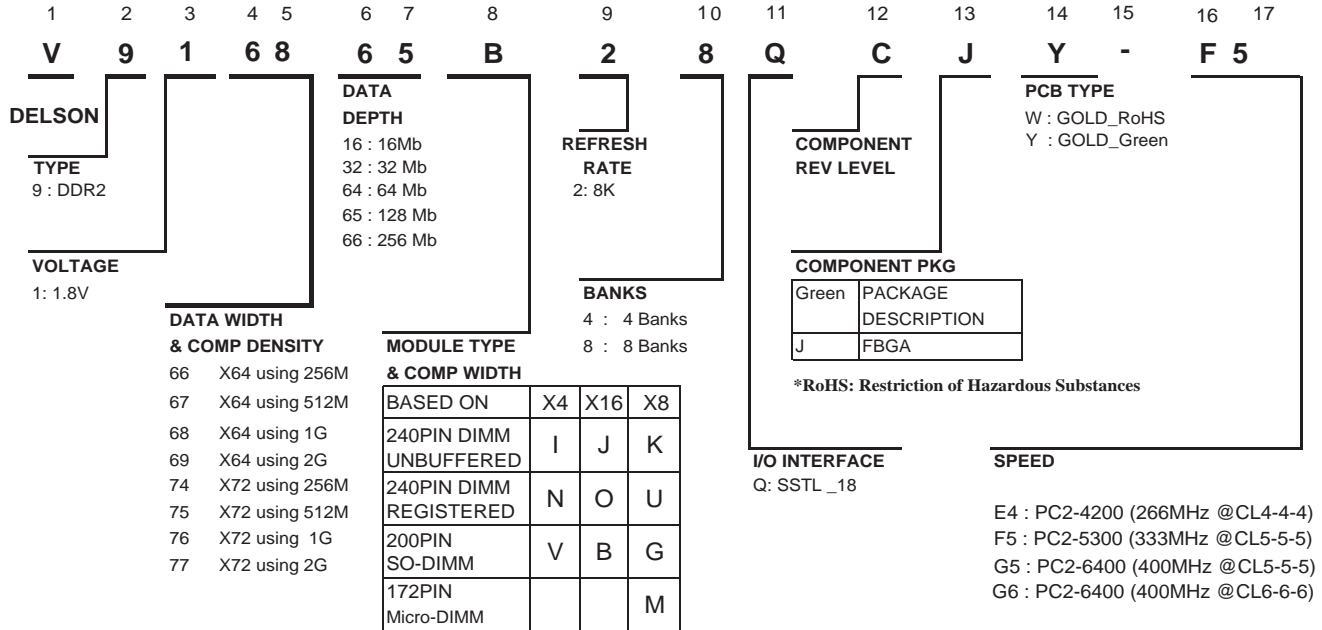

The V916865B28QC memory module is organized as 134,217,728 x 64 bits in a 200 pin memory module. The 128M x 64 memory module uses 8 ProMOS 64M x 16 DDR2 SDRAMs. The x64 modules are ideal for use in high performance computer systems where increased memory density and fast access times are required.

Input/Output Functional Description

Symbol	Type	Polarity	Function
CK0/ $\overline{\text{CK}}0$, CK1/ $\overline{\text{CK}}1$	Input	Cross point	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of $\overline{\text{CK}}$. A Delay Locked Loop (DLL) circuit is driven from the clock inputs and output timing for read operations is synchronized to the input clock.
CKE[1:0]	Input	Active High	Activates the DDR2 SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
$\overline{\text{S}}[1:0]$	Input	Active Low	Enables the associated DDR2 SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by $\overline{\text{S}}0$; Rank 1 is selected by $\overline{\text{S}}1$.
$\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$	Input	Active Low	When sampled at the cross point of the rising edge of CK and falling edge of $\overline{\text{CK}}$ and $\overline{\text{CAS}}$, RAS, and WE define the operation to be executed by the SDRAM.
BA[2:0]	Input	—	Selects which DDR2 SDRAM internal bank of four or eight is activated.
ODT[1:0]	Input	Active High	Asserts on-die termination for DQ, DM, DQS, and $\overline{\text{DQS}}$ signals if enabled via the DDR2 SDRAM mode register.
A[9:0], A10/AP, A[15:11]	Input	—	During a Bank Activate command cycle, defines the row address when sampled at the cross point of the rising edge of CK and falling edge of $\overline{\text{CK}}$. During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of $\overline{\text{CK}}$. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0-BAn inputs. If AP is low, then BA0-BAn are used to define which bank to precharge.
DQ[63:0]	In/Out	—	Data Input/Output pins.
DM[7:0]	Input	Active High	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect.
$\overline{\text{DQS}}[7:0]$, DQS[7:0]	In/Out	Cross point	The data strobes, associated with one data byte, sourced with data transfers. In Write mode, the data strobe is sourced by the controller and is centered in the data window. In Read mode, the data strobe is sourced by the DDR2 SDRAMs and is sent at the leading edge of the data window. $\overline{\text{DQS}}$ signals are complements, and timing is relative to the crosspoint of respective DQS and $\overline{\text{DQS}}$. If the module is to be operated in single ended strobe mode, all $\overline{\text{DQS}}$ signals must be tied on the system board to VSS and DDR2 SDRAM mode registers programmed appropriately.
V _{DD} , V _{DD} SPD, V _{SS}	Supply	—	Power supplies for core, I/O, Serial Presence Detect, Thermal sensor, and ground for the module.
V _{REF}	Supply	—	Reference voltage for SSTL18 inputs.
SDA	In/Out	—	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM or Thermal sensor. A resistor must be connected from the SDA bus line to V _{DD} SPD on the system planar to act as a pull up.
SCL	Input	—	This signal is used to clock data into and out of the SPD EEPROM and Thermal sensor.
SA[1:0]	Input	—	Address pins used to select the Serial Presence Detect base address.
TEST	In/Out	—	The TEST pin is reserved for bus analysis tools and is not connected on normal memory modules (SO-DIMMs).
$\overline{\text{Event}}$	Wire-OR Out	Active Low	The optional EVENT pin is reserved for use to flag critical module temperatures and is used in conjunction with a SPD temperature sensing option.

I/O Termination Voltage(system)	VTT	VREF-0.04	VREF	VREF+0.04	V	3

Note:

1. VDD and VDDQ must track each other. VDDQ must be less than or equal to VDD.
2. VREF is expected to equal to VDDQ/2 of the transmitting device and to track variations in the DC level of the same. Peak to Peak AC noise on the VREF may not exceed +/-2% VREF(DC).
3. VTT of the transmitting device must track VREF of receiving device.
4. VDDQ tracks with VDD; VDDL tracks with VDD.
